# Referential Integrity Constraint

## Referenced Relation

Table DEPT		
DEPTNO	DNAME	LOC
20	RESEARCH	DALLAS
30	SALES	CHICAGO

Each value in the DNAME column must be unique

Each row must have a value for the ENAME column

Each value in the DEPTNO column must match a value in the DEPTNO column of the DEPT table

Table EMP					
EMPNO	ENAME	... Other Columns ...	SAL	COMM	DEPTNO
6666	MULDER		5500.00		20
7329	SMITH		9000.00		20
7499	ALLEN		7500.00	100.00	30
7521	WARD		5000.00	200.00	30
7566	JONES		2975.00	400.00	30

Referencing  
Relation

Each row must have a value for the EMPNO column, and the value must be unique

Each value in the SAL column must be less than 10,000

CE

# Referential Integrity Constraint (Cont.)

- Tuples in the **referencing relation** R1 have attributes FK (called **foreign key** attributes) that reference the primary key attributes PK of the **referenced relation** R2.

**A tuple t1 in R1 is said to reference a tuple t2 in R2 if**

$$t1[FK] = t2[PK].$$

- The value in the foreign key column (or columns) i.e. FK of the the **referencing relation** R1 can be **either**:

a) a value of an existing primary key value of a corresponding primary key PK in the referenced relation R2,

or

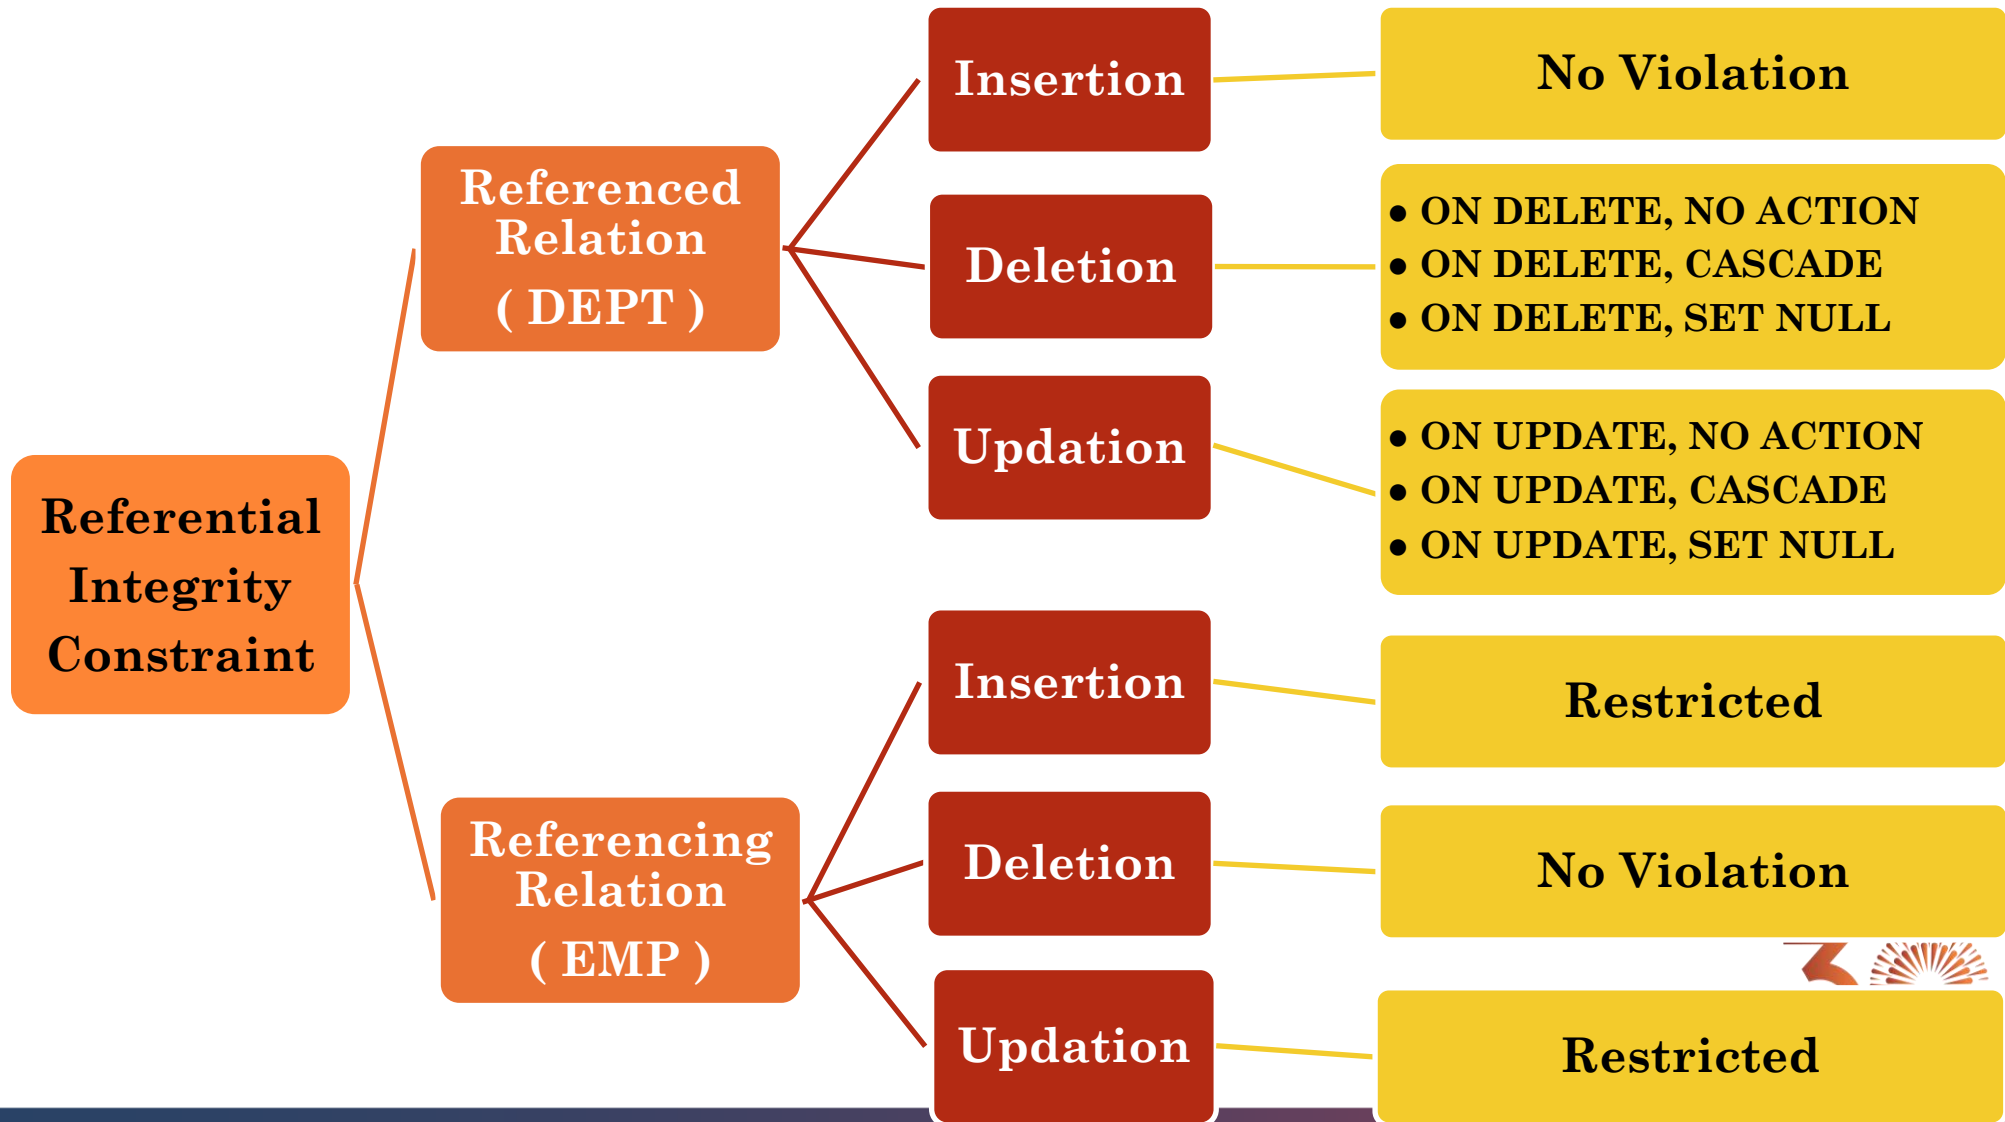

b) a null.

# Referential Integrity Constraints

Referential integrity also includes the rules that dictate what types of data manipulation are allowed on referenced values and how these actions affect dependent values.

# Referential Integrity Constraints

# Referential Integrity Constraint - INSERTION

**Table DEPT**

DEPTNO	DNAME	LOC
20	RESEARCH	DALLAS
30	SALES	CHICAGO

Each value in the DNAME column must be unique

Insertion in Referenced Relation is allowed

Each row must have a value for the ENAME column

Each value in the DEPTNO column must match a value in the DEPTNO column of the DEPT table

**Table EMP**

EMPNO	ENAME	... Other Columns ...	SAL	COMM	DEPTNO
6666	MULDER		5500.00		20
7329	SMITH		9000.00		20
7499	ALLEN		7500.00	100.00	30
7521	WARD		5000.00	200.00	30
7566	JONES		2975.00	400.00	30

Each row must have a value for the EMPNO column, and the value must be unique

Each value in the SAL column must be less than 10,000

Insertion in Referencing Relation is restricted

# Deletion/Updation in Referenced Relation

ON DELETE, CASCADE

ON UPDATE, CASCADE

**Table DEPT**

7566	JONES		2975.00	400.00	30

# Primary key vs Foreign Key

## Primary Key

- Helps you to uniquely identify a record in the table.
- Primary Key never accept null values.
- Primary key is a clustered index and data in the DBMS table are physically organized in the sequence of the clustered index.
- You can have the single Primary key in a table.

## Foreign Key

- It is a field in the table that is the primary key of another table.
- A foreign key may accept multiple null values.
- A foreign key cannot automatically create an index, clustered or non-clustered. However, you can manually create an index on the foreign key.
- You can have multiple foreign keys in a table.

# Summary

## Common database keys explained

### PRIMARY KEY

A column or set of columns in a database table that serves as a unique identifier. Examples include customer or employee numbers, email addresses and telephone numbers.

### CANDIDATE KEY

A column or set of columns in a table that can potentially be used as a primary key. To qualify, it must be able to function as a unique identifier to sort all of the table's data records.

### SUPER KEY

A set of data attributes from different columns in a table that can be used as an identifier. For example, columns containing employee numbers and email addresses could be combined.

### FOREIGN KEY

A column in one database table that is linked to the primary key in another table. Foreign keys are used to make data available in different tables without having to create redundant data sets.

Thanks!!
